COVID-19 Data, Charts Northern Virginia & Virginia April 6, 2021

Context: Data Limitations

- COVID-19 data summarized in the table and charts below comes from the public use database developed by the Virginia Department of Health. The table (Slide 3) combines Falls Church and Fairfax City data with that of Fairfax County, and data for Manassas and Manassas Park with that of Prince William County.
- Case counts are of those who have tested positive for the novel coronavirus. Testing levels and protocols remain insufficient to determine actual levels of exposure and infection. The available data is not sufficient to calculate reliably the incidence or prevalence of the disease locally or statewide. The undercount and associated uncertainty necessarily limits the value of the ratios or rates that we have derived, but combined with the data and charts we have distributed over the last year they give an idea of Virginia and Northern Virginia trends, and regional differences in infection levels, hospitalizations and mortality.
- Hospitalization counts are more reliable, but that data too has limitations. For example the source of admission for COVID-19 hospital cases is not available. So, one cannot determine reliably the number of cases referred to hospitals from nursing homes, assisted living facilities or other congregate living settings. The published data does not permit linkage between sites where infection and treatment occur.
- COVID-19 exposure and documented infection, hospitalization and mortality were much higher in Northern Virginia than elsewhere in the state during the initial months of the pandemic. That has changed steadily, and dramatically, since mid 2020. The early difference between Northern Virginia (PD 8) and the rest of state diminished as the epidemic spread more widely since last summer. Rather than more than one-half of documented cases, hospitalizations and deaths reported during the early months of the epidemic, Northern Virginia (PD8) now has lower COVID-19 case and death rates than other regions of the state, and notably fewer documented COVID-19 cases and deaths than its share of the state population. Northern Virginia hospitalization rates continue to be higher than in other Virginia planning regions.
- The information presented below should be considered descriptive. The data, and the derived ratios and rates, presented are illustrative, not definitive. They will be updated as information becomes available.
- The array of COVID-19 data, and related information, for Virginia residents and medical services and facilities statewide is available at: <https://www.vdh.virginia.gov/coronavirus/>
